

Abstract

The invention relates to pharmaceutical preparations that contain at least one emulsifier, at least one auxiliary emulsifier and/or solvent as well as at least one lipid, characterized in that the mass ratio of emulsifier to auxiliary emulsifier and/or solvent (S_{mix}) is 1:1 to 9:1 and the total lipid proportion is $> 0\%$ (m/m), whereby this preparation at least partially inhibits at least one intestinal enzyme and/or at least one intestinal efflux system. These preparations can be used to increase the bioavailability of pharmaceutical substances that are lipophilic and/or substrates of intestinal metabolizing enzymes and/or intestinal efflux systems, especially steroids.
